

Aggressive Risk Factor Modification to Reduce Atrial Fibrillation: Is the Evidence Conclusive?

Ratika Parkash MD MS FRCPC FHRS

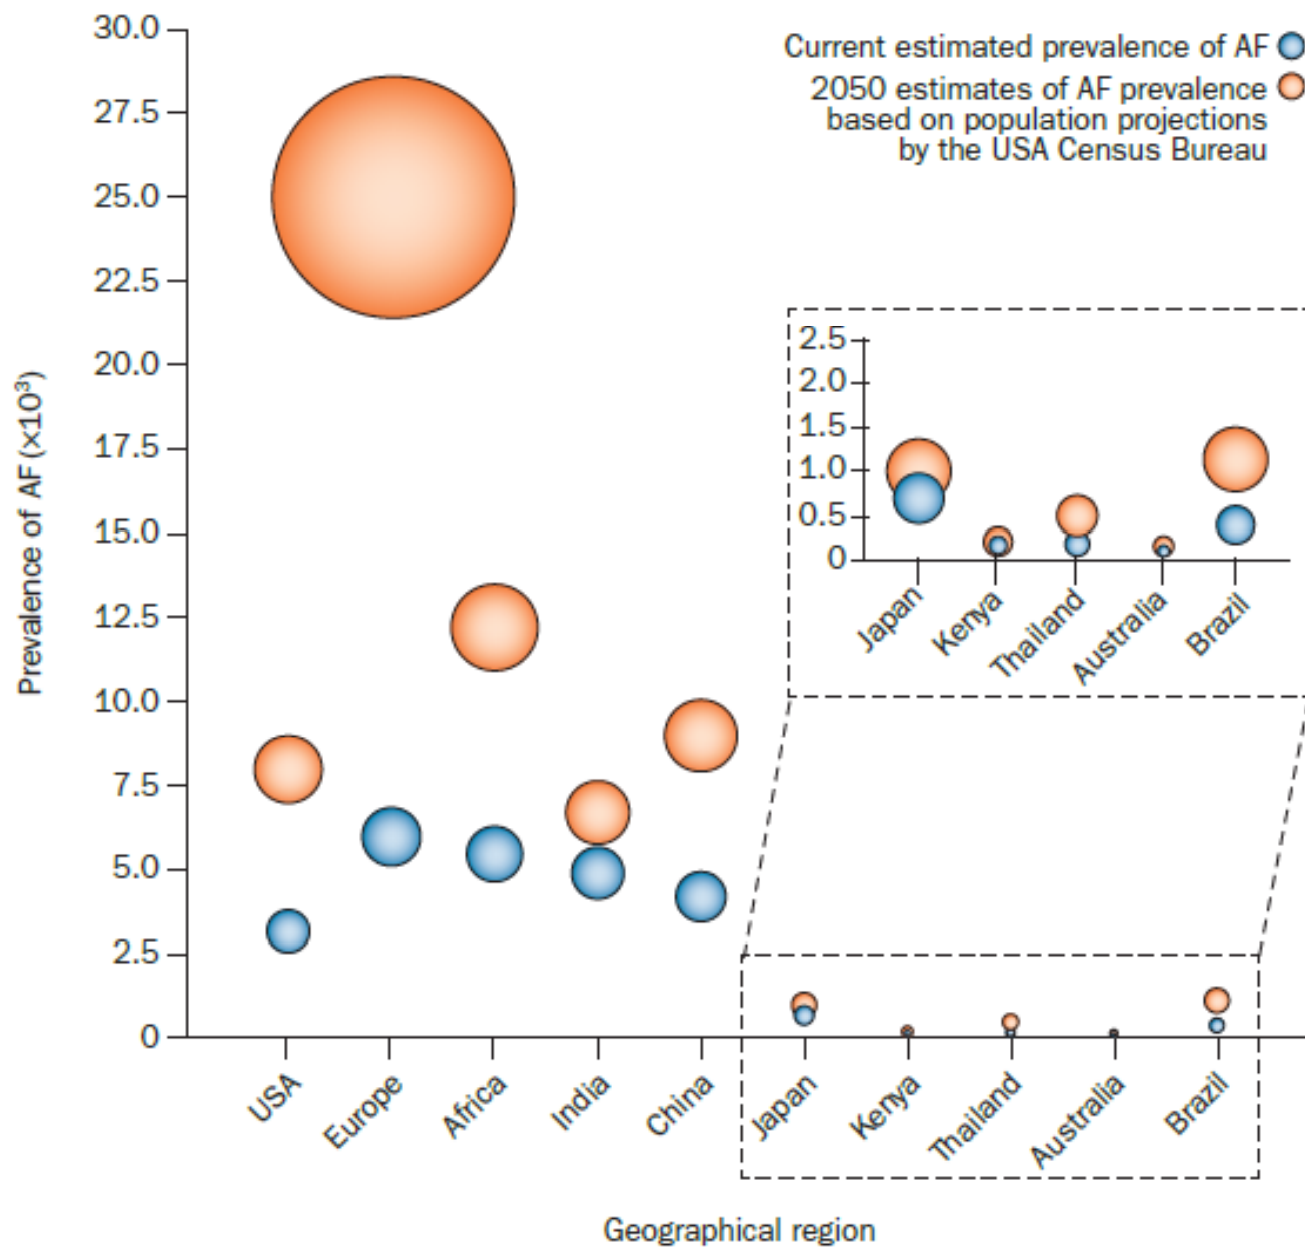

Professor, Dalhousie University

QEII Health Sciences Center

Halifax, Nova Scotia

Prevalence of Atrial Fibrillation

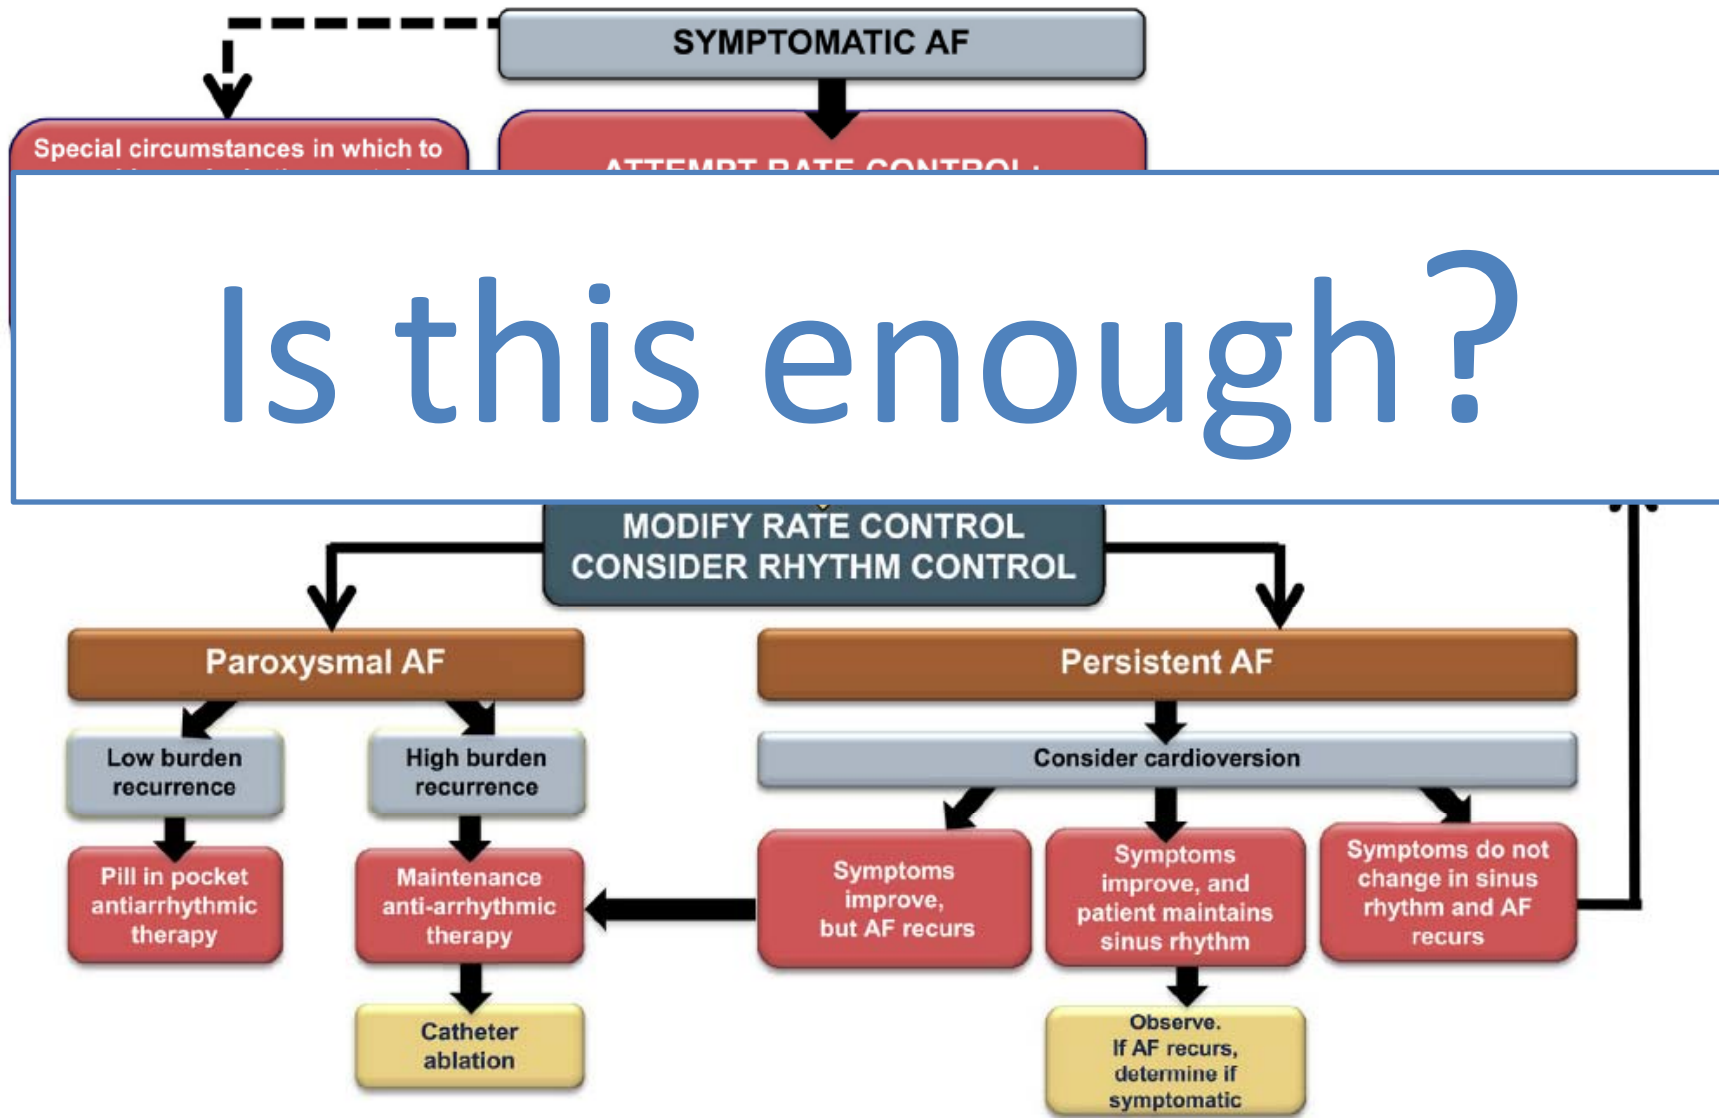

*In 2011, an estimated **5.0 million** Canadians were 65 years of age or older, a number that is expected to double in the next 25 years to reach **10.4 million** seniors by 2036. By 2051, about one in four Canadians is expected to be 65 or over.*

Treatment of AF

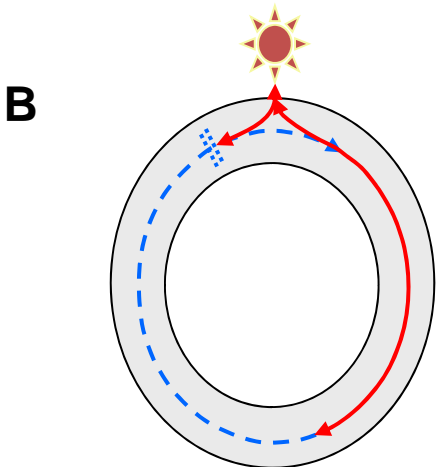

General schema representing AF mechanisms and the role of remodeling.

Substrate for Reentry in AF

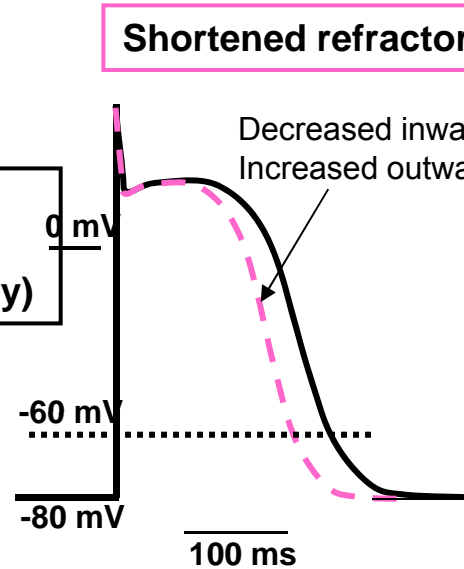

Fundamental determinants of reentry:
 -ERP (short favors reentry)
 -conduction velocity (slow favors reentry)

How remodeling promotes reentry

C

D

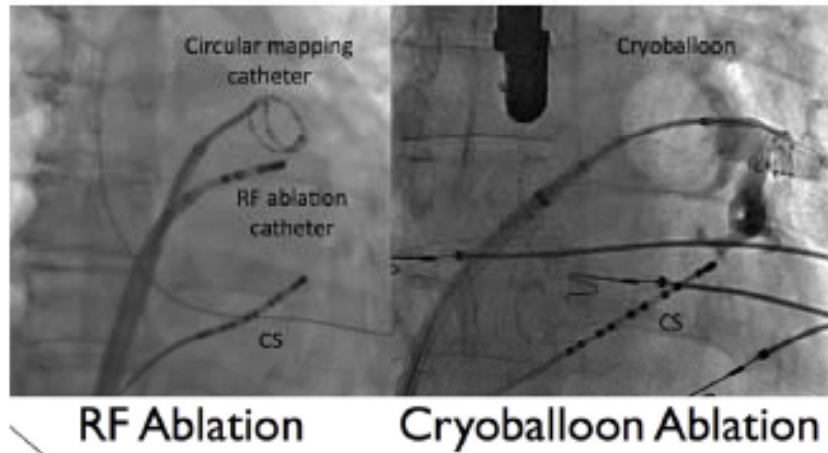

Progression of AF

Established Risk Factors for AF

- Age and gender (>45 for men, >60 for women)
- PR interval (≥ 160 ms)
- Body Mass Index (≥ 30) **Modifiable**
- Valvular Heart Disease (higher risk if younger at onset)
- Heart Failure (higher risk if younger at onset)
- Systolic blood pressure (≥ 160 mm Hg) **Modifiable**
- Sleep Apnea **Modifiable**
- Alcohol intake **Modifiable**
- Exercise **Modifiable**

Current Status of Therapy in AF

What are the incremental gains to be made in treatment of AF?

What are the incremental gains to be made in treatment of AF?

- Prevention of AF?
 - Target modifiable risk factors upstream including obesity, hypertension and its resultant effects including diabetes and sleep apnea
 - May be primary or secondary

- Providing optimal care to those who have AF?
 - Specialized clinics: prevent ED visits, hospitalizations, address gaps in care
 - Access to catheter ablation

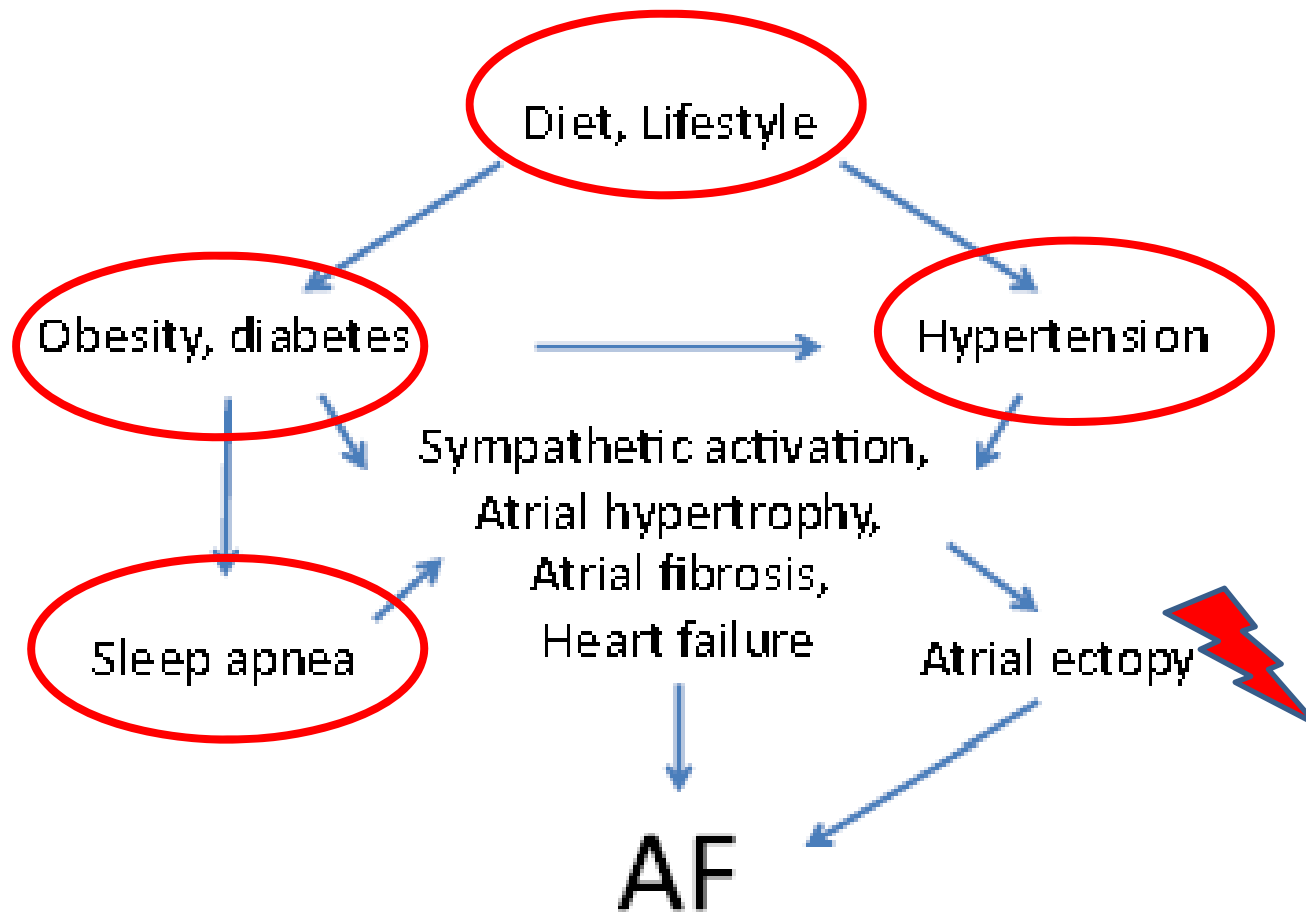

Is AF a disease?

AF is a symptom, not a disease

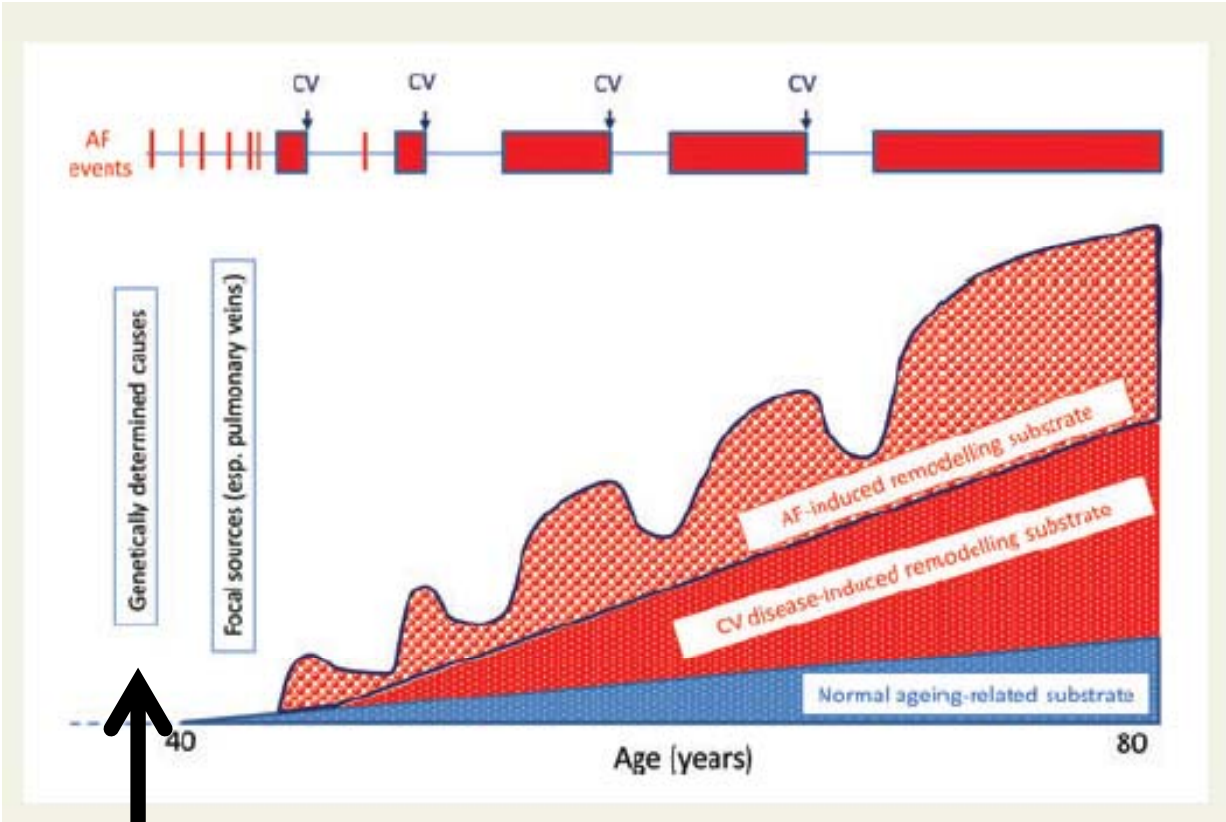

Substrate Modification to Prevent AF

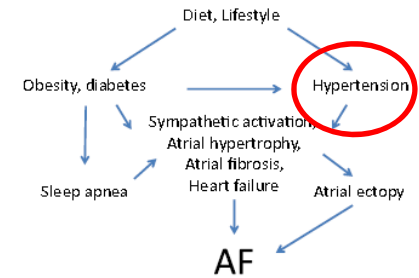

Progression of AF – when is the right time to intervene?

Before onset of clinical AF:
Risk factors:
Does intervention lead to prevention of AF?

Once AF develops, can we do better to prevent progression and quality of life?

Blood pressure and AF

| Systolic BP (mm Hg) | <120 | 120-129 | 130-139 | 140-159 | ≥160 |
|---------------------|------|--------------------|---------------------|---------------------|---------------------|
| Risk of AF | Ref | 1.18 (0.9,1.52) | 1.43 (1.09,1.87) | 1.78 (1.34,2.38) | 2.29 (1.45,3.63) |
| | | | | | |

Renal Denervation and AF

From: **Obesity and the Risk of New-Onset Atrial Fibrillation**

JAMA. 2004;292(20):2471-2477. doi:10.1001/jama.292.20.2471

| Men | | Women | | | | | | | | |
|------------|------|-------|------|-----|-----|------|------|------|------|------|
| | 0 | 2 | 4 | 6 | 8 | 10 | 12 | 14 | 16 | |
| Obese | 413 | 380 | 336 | 280 | 238 | 464 | 444 | 397 | 345 | 299 |
| Overweight | 1216 | 1143 | 1023 | 908 | 776 | 898 | 852 | 776 | 696 | 614 |
| Normal | 755 | 699 | 614 | 557 | 482 | 1536 | 1476 | 1394 | 1282 | 1180 |

BMI ≥ 30 in both men and women; BMI 25-30 in women also a risk

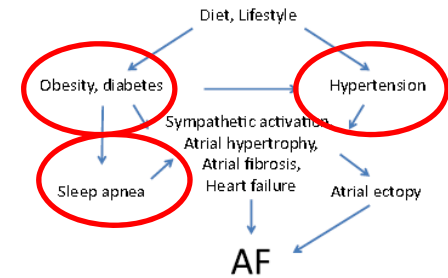

Figure Legend:

Horizontal axis represents time since the baseline examination. Bodymass index categories were as follows: normal, <25.0 ; overweight, 25.0 to <30.0 ; and obese, ≥ 30.0 .

Obesity – RCT data in AF

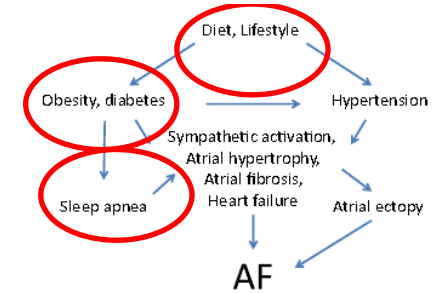

- Abedat et al performed a single center RCT in patients with paroxysmal or persistent AF with one of the following: BMI > 27, waist circumference > 100 cm in men, >90 cm in women
- Patients underwent intensive management of obesity and cardiometabolic risk factors (hypertension, hyperlipidemia, glucose intolerance, sleep apnea and tobacco use)
- Patients were prescribed exercise, low-calorie diet

- Followed for 15 months
- Primary outcome AF symptom burden using AFSS
- Secondary outcome 7 day Holter derived AF episodes and duration, LA area, LV wall thickness

From: **Effect of Weight Reduction and Cardiometabolic Risk Factor Management on Symptom Burden and Severity in Patients With Atrial Fibrillation: A Randomized Clinical Trial**

JAMA. 2013;310(19):2050-2060. doi:10.1001/jama.2013.280521

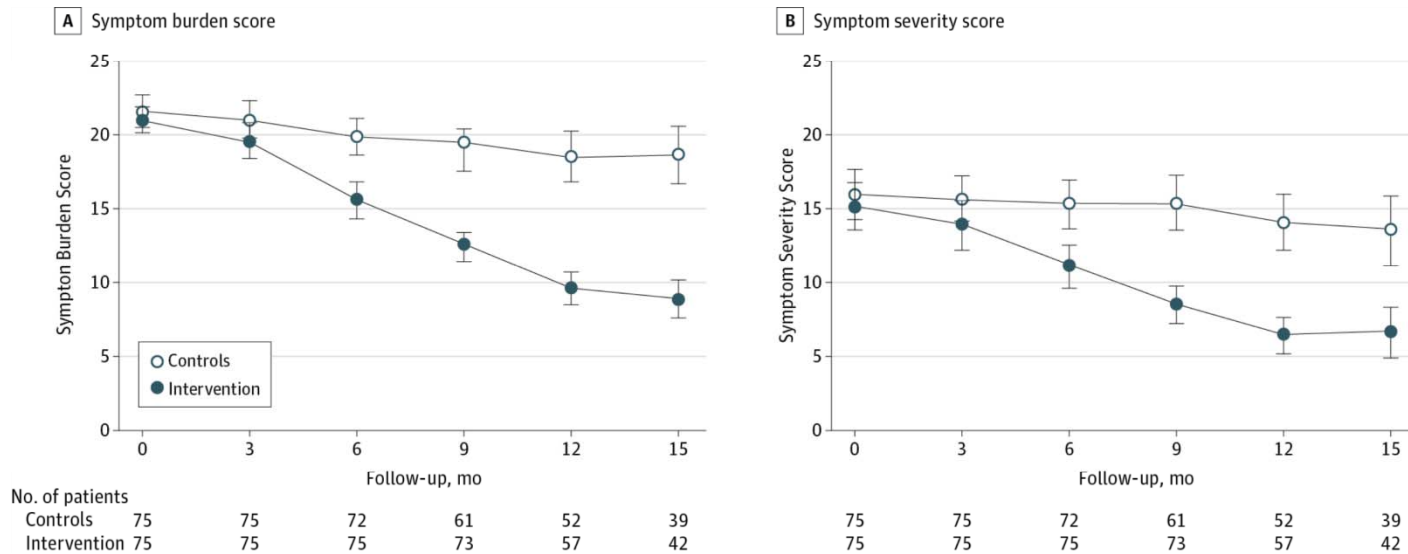

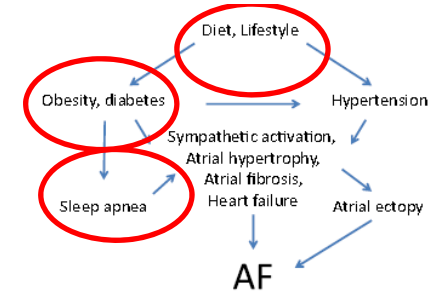

Significant reduction in BMI and Waist circumference

Figure Legend:

Changes in Waist Circumference and Body Mass Index From Baseline (Enrollment) to 15 Months' Follow-up. Error bars indicate 95% confidence intervals. BMI indicates body mass index, calculated as weight in kilograms divided by height in meters squared. A, Between-group level of significance: $P = .21$ at time 0, $P = .01$ at 3 months, $P < .001$ at 6, 9, 12, and 15 months. B, Between-group level of significance: $P = .13$ at time 0, $P < .001$ at 3, 6, 9, 12, and 15 months.

From: **Effect of Weight Reduction and Cardiometabolic Risk Factor Management on Symptom Burden and Severity in Patients With Atrial Fibrillation: A Randomized Clinical Trial**

JAMA. 2013;310(19):2050-2060. doi:10.1001/jama.2013.280521

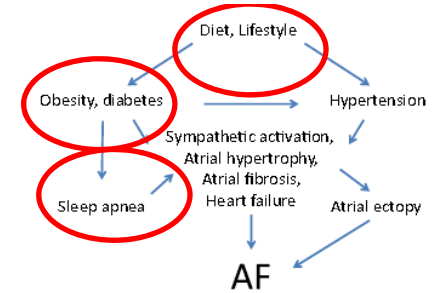

Significant reduction in AF symptom burden score and symptom severity score

Figure Legend:

Changes in Atrial Fibrillation Symptom Scale (AFSS) Scores Over Study Follow-up. Error bars indicate 95% confidence intervals. A, Between-group level of significance: $P = .41$ at time 0, $P = .12$ at 3 months, $P < .001$ at 6, 9, 12, and 15 months. B, Between-group level of significance: $P = .49$ at time 0, $P = .17$ at 3 months, $P < .001$ at 6, 9, 12, and 15 months.

AF episodes and duration

- Mean number of episodes decreased from 3.3 to 0.62 – on 7 day Holters done at baseline and 12 months
- Duration of AF decreased from 19.3 hours to 8.2 hours ($p < 0.001$ for both)
- No change in the control group
- Also noted improvement in LA area and LV mass

LEGACY: cohort study

| Time (Days) | 0 | 365 | 730 | 1095 | 1460 | 1825 |
|----------------|-----|-----|-----|------|------|------|

| <3% WL or gain | 117 | 105 | 85 | 53 | 32 | 22 |

Sleep Apnea and AF

Associated Factors with OSA

Arrhythmogenic Mechanisms: Sleep apnea in AF Increase in LVEDP

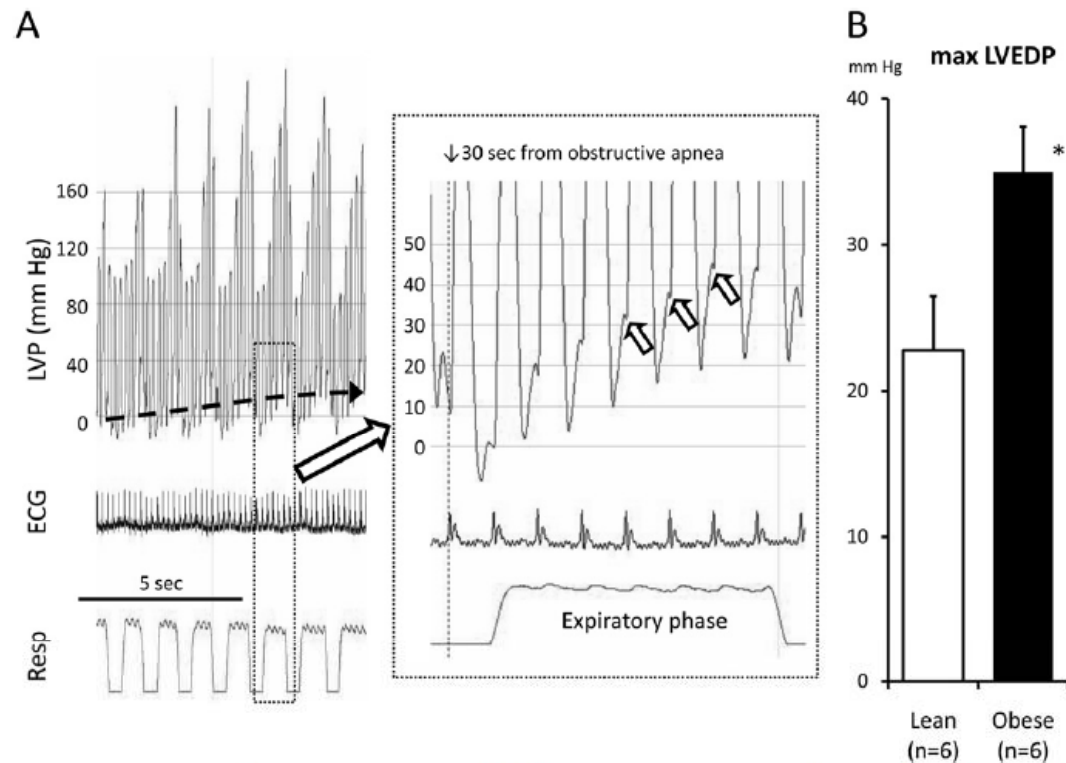

Figure 3 Left ventricular pressure changes during obstructive apnea. **A:** Obstructive apnea progressively increased left ventricular end-diastolic pressure (LVEDP), with a gradual increase (*dashed arrow*) superimposed on periodic changes associated with respiration (*open arrows*). **B:** Maximum LVEDP during obstructive apnea was higher in obese vs lean rats.

Arrhythmogenic Mechanisms: Sleep apnea in AF Left atrial distension

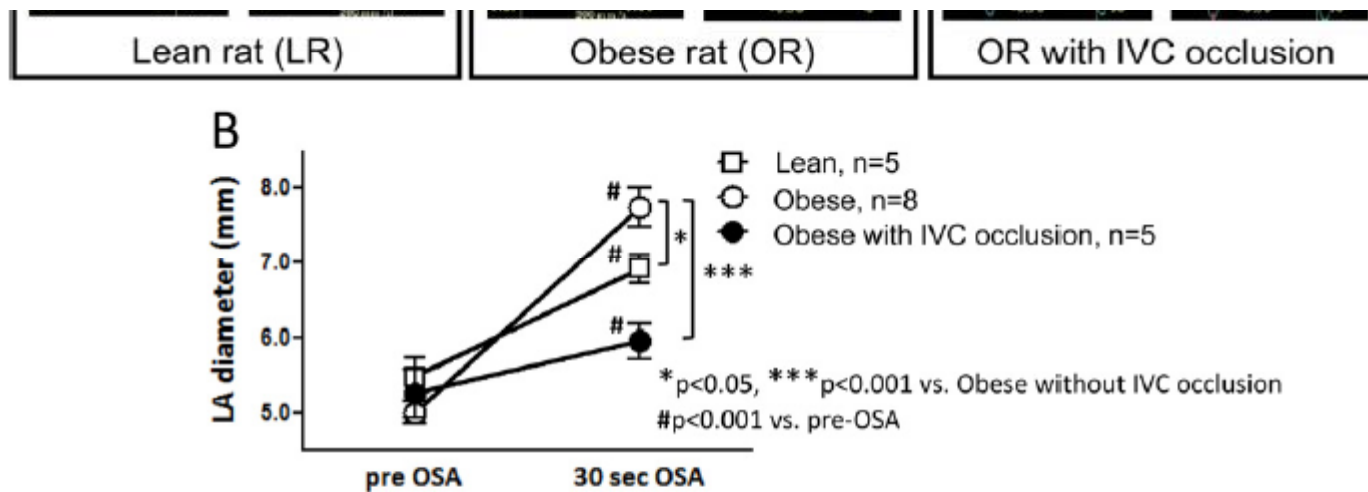

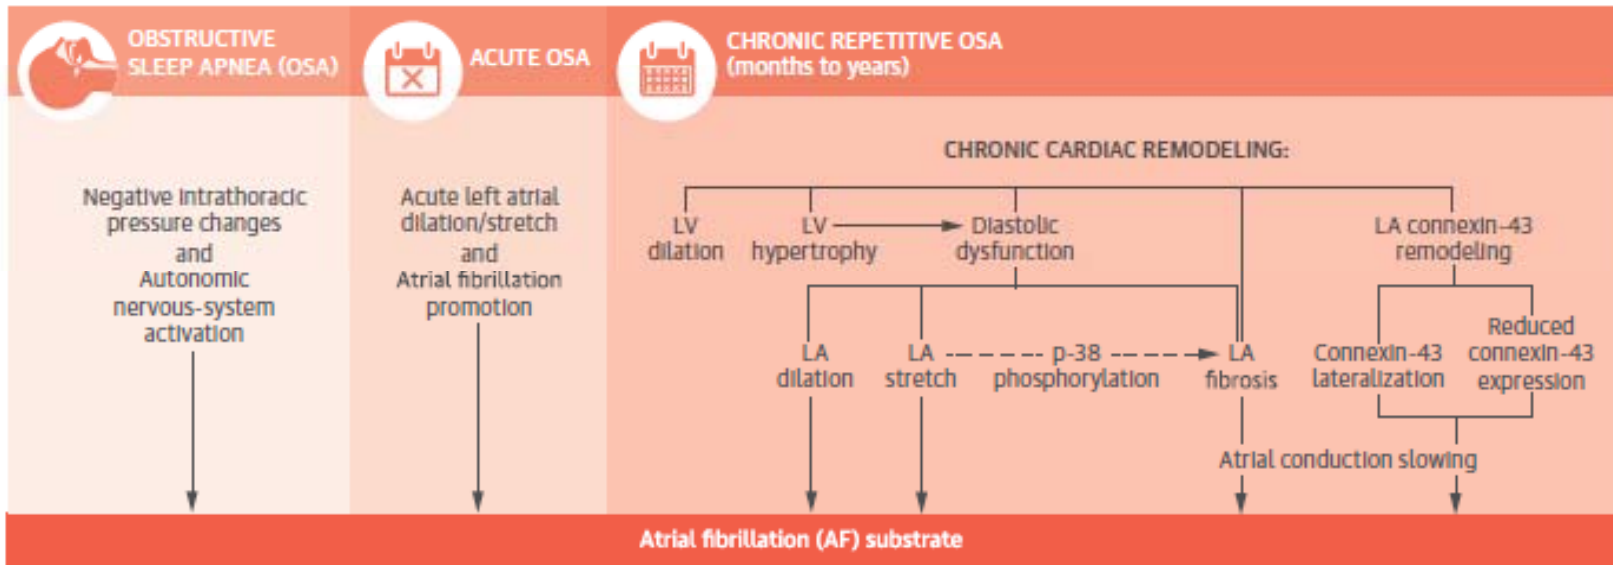

Figure 4 Acute left atrial (LA) distension during obstructive sleep apnea (OSA). **A:** M-mode images showing changes in LA dimensions with OSA in a lean rat (LR), an obese rat (OR), and the obese rat after inferior vena cava (IVC) balloon occlusion. **B:** LA diameter changes (mean \pm SEM).

ORBIT AF – 1 in 5 patients had OSA

Effect of CPAP on Cardiovascular Outcomes

| Outcome | CPAP (n = 937) | No CPAP (n = 687) | Unadjusted HR (95% CI) | P | Adjusted HR (95% CI) | P |
|-----------------------------------|---|---|---------------------------|-----|-------------------------|-----|
| | No. of events (events/100 patient-years) | No. of events (events/100 patient-years) | | | | |
| All-cause death | 68 (4.44) | 54 (4.86) | 0.92 (0.67-1.25) | .58 | 1.10 (0.78-1.54) | .60 |
| First hospitalization (all-cause) | 471 (43.9) | 329 (41.9) | 1.05 (0.93-1.18) | .42 | 1.10 (0.97-1.24) | .14 |
| CV death, MI, stroke/TIA | 57 (3.78) | 41 (3.73) | 1.02 (0.68-1.52) | .94 | 1.15 (0.73-1.82) | .55 |
| Major bleeding | 71 (4.81) | 43 (3.99) | 1.20 (0.85-1.71) | .29 | 1.45 (0.99-2.11) | .06 |

| Outcome | CPAP (n = 602) | No CPAP (n = 411) | Unadjusted OR (95% CI) | P | Adjusted OR (95% CI) | P |
|------------------------|-------------------------|-------------------------|---------------------------|-----|-------------------------|-----|
| | No. of events (percent) | No. of events (percent) | | | | |
| Progression of AF type | 94 (16) | 75 (18) | 0.74 (0.55-0.99) | .04 | 0.66 (0.46-0.94) | .02 |

Effect of Obstructive Sleep Apnea Treatment on Atrial Fibrillation Recurrence

I am unable to sleep during meetings.

ARREST-AF Cohort Study

Risk factors: hypertension, glucose intolerance/DM, hyperlipidemia, OSA, smoking or alcohol excess

Intervention

- Risk factor management in a physician-directed clinic at the time of initial assessment
- Attended RFM clinic every 3 months
- BP measured 3x/day with home BP monitor
- EST done to optimize BP therapy
- Lifestyle advice regarding salt restriction
- BP < 130/80
- Structured motivational, goal-directed program with face-to-face counseling for weight reduction – meal plan and behaviour modification
- Lipid management with medications or lifestyle
- Glycemic control – lifestyle, medications, specialized diabetes clinic if $\text{HbA}_{1c} > 7\%$
- Sleep testing in hospital
- Smoking cessation
- Alcohol reduction

Effect of RFM intervention

- Significant decrease in weight 100 to 87.5
- Drop in SBP from 161 to 127
- No patients with HbA1c \geq 7% at follow up
- Sleep apnea improved dramatically
- LA size decreased
- AF severity improved dramatically
- Median follow up 42 months

Recurrence of AF

| Time (days) | 0 | 180 | 360 | 540 | 730 |
|-------------|----|-----|-----|-----|-----|
| RFM | 61 | 59 | 48 | 33 | 27 |
| Control | 88 | 79 | 51 | 28 | 16 |

| Time (days) | 0 | 180 | 360 | 540 | 730 |
|-------------|----|-----|-----|-----|-----|
| RFM | 61 | 55 | 46 | 32 | 25 |
| Control | 88 | 72 | 51 | 36 | 23 |

Integrated Management Approach to AF

| Baseline Characteristics | AF Clinic (n = 168) | Usual Care (n = 168) | P value |
|--------------------------------|---------------------|----------------------|---------|
| Age (mean ± SD) | 62.8 ± 14.5 | 61.9 ± 15.4 | 0.56 |
| Female | 58 (39.5%) | 64 (38.1%) | 0.82 |
| Hypertension | 64 (38.1%) | 62 (36.9%) | 0.91 |
| Diabetes | 20 (11.9%) | 18 (10.7%) | 0.86 |
| Congestive heart failure | 17 (10.1%) | 15 (8.9%) | 0.85 |
| Stroke | 9 (5.4%) | 11 (6.5%) | 0.82 |
| Prior myocardial infarction | 10 (6%) | 11 (6.5%) | 1 |
| Peripheral vascular disease | 6 (3.6%) | 3 (1.8%) | 0.5 |
| Cerebrovascular disease | 2 (1.2%) | 5 (3%) | 0.45 |
| Chronic pulmonary disease | 22 (13.1%) | 16 (9.5%) | 0.39 |
| Sleep apnea | 16 (9.5%) | 11 (6.5%) | 0.42 |
| LVEF (mean ± SD) | 57.3 ± 8.2 | 56 ± 9.3 | 0.17 |
| CHADS ₂ (mean ± SD) | 1.0 ± 1.2 | 1.1 ± 1.2 | 0.4 |
| CHADS-VASC (mean ± SD) | 2.0 ± 1.7 | 2.0 ± 1.7 | 0.85 |
| BMI > 27 | 117 (58.0%) | - | |

Present at baseline, not when screening performed

What are the clinical questions that remain unanswered in risk factor management in AF?

| Risk Factor | Current Evidence | Research needed |
|----------------------------|---|--|
| Obesity | 2 RCTs at same center, both single center; QOL, recurrence of AF; used 7 day Holters to quantify AF | How best to promote and maintain weight loss over long term |
| Alcohol Intake | - | Effect of alcohol reduction on recurrence of AF is required |
| Physical Activity/Exercise | Recent RCT suggests aerobic interval training | Exact exercise prescription - ?dose response relationship |
| Sleep apnea | SR suggests reduction in AF | RCT with other lifestyle interventions is required to show benefit of screening and treatment ?mild sleep apnea |
| Hypertension | SMAC AF – results in one year; SPRINT | In combination with other risk factors |
| Diabetes | Abed et al; ARREST AF | Effect of glycemic control on recurrence of AF is unknown |

Other Considerations:

Dietary consumption – fish oil???

Air pollutions

Early intervention with catheter ablation

Atrial
fibrillation

Heart
Function

Respirology
(Sleep Apnea)

Hypertension

Device

Obesity
Management

Cardiac
Rehabilitation

Conclusions

- Good evidence that risk factors lead to AF and are associated with progression
- Some low quality evidence that modification of these improve AF episodes
- Currently, insufficient evidence to result in a systematic change in AF management

Thank you!
